Project	
Project Title	ITEC Management System
Executive Summary	The ITEC Management System is a comprehensive desktop application designed to streamline various administrative and operational aspects of an ITEC event or organization. At its core, the system is built using Windows Forms in C#, with each module addressing a specific area of management. It interacts with a MySQL database to handle data storage and retrieval, ensuring that all operations—from adding records to updating statuses—are performed efficiently. One of the key modules is the User Fee Tracking component. This module allows users to view, search, and update fee payment statuses. For example, participants can see details of their event fees, including the event name, fee amount, and whether the fee is pending or has been paid. The interface provides filtering options and search capabilities, making it easy to navigate through a potentially large dataset. Additionally, it includes functionality for marking fees as paid, which updates the database and reflects the change in real time. The system also includes a Venue Management module, where users can add, update, delete, and search for venue details. This section helps in organizing event locations by capturing essential information such as the venue name, capacity, and location. The intuitive design of the form, complete with a data grid for viewing existing venues, ensures that event organizers can manage venues effectively. Another important module is Committee Management, which focuses on organizing the committees responsible for various aspects of the event.

	Here, users can add new committees, update existing ones, and remove committees as necessary. The module ties committee management with the edition of the event (or ITEC edition), ensuring that each committee is aligned with a particular event year or theme. This linkage helps in maintaining consistency and historical data for multiple editions of the event. In addition to these, the Duty Management module assists in assigning tasks to committee members. It facilitates the scheduling of duties, setting deadlines, and tracking the status of each task. Users can easily update or delete duties, ensuring that the workload distribution remains clear and manageable. The form design incorporates dynamic components like combo boxes that load committee members based on the selected committee, making the process interactive and user-friendly. Lastly, the Edition Management module allows the system to handle different editions of the ITEC event. By capturing the year, theme, and description for each edition, the system supports historical tracking and planning for future events. Overall, the ITEC Management System is a well-integrated solution that centralizes the management of event fees, venues, committees, duties, and event editions, ultimately enhancing the operational efficiency and organization of the event. Overall , the system to use to manage the complete system with also generate the useful reports of different aspects . it correctly manage the database for all the CRUD and management functions and features .
